

Design a simple application where the user is presented with a quiz and the questions are from the following 5 domains -

1. Countries and their capitals
2. Countries and their currencies
3. Number of bordering countries
4. Continent it belongs to
5. Number of timezones in the country

```
questions = ["What is the capital of ", "What is the currency used in ", ""]  
countries= []
```

What is the capital of <>

Problem description

1. Create a list of countries that you can think of (say 15-20. Maybe?). Initialize an array named countries[]
2. Create a list of 5 questions specified above. questions[]
3. Randomly select one country from the countries[] array.
4. Ask a question from the country selected in step-2
5. Go-to step 3

API to be used: <https://restcountries.com/v3.1/name/{name}>

Also maintain a score for the player. Return the score at the end of the game with a congratulatory message!
